Features

 Direct operated directional seat valve with solenoid actuation Porting pattern according to ISO 4401-05-04-0-05 and NFPA T3.5.1 R2-2002 D05 Blocked connection tight
 Safe switching also with longer standstill periods under pres- sure
 Air-gap DC voltage solenoids with detachable coil (AC volt- age possible by means of a rectifier)
 Solenoid coil can be rotated by 90°
 Electrical connection as individual connection (for more electrical connections see RE 08010)
- with concealed manual override, optional
 Inductive position switch (contactless), optional, see RE 24830.

¹⁾ Mating connectors, separate order, see page 12.

²⁾ For connection to the AC voltage mains, a DC voltage solenoid **must** be used, which is controlled via a rectifier (see table above).

In case of individual connections, a mating connector with integrated rectifier can be used (separate order, see page 12). Standard types and units are contained in the EPS (standard price list).

Function, section, symbols: 3/2-directional seat valve

General

The directional valve type M-.SEW is a directional seat valve with solenoid actuation. It controls start, stop and direction of the flow.

It basically comprises a housing (1), the solenoid (2), the hardened valve system (3) and the spool (8) as closing element.

Basic principle

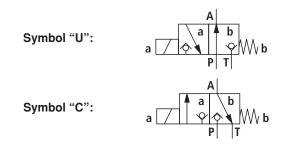

In the initial position, the spool (8) is pressed onto the seat by the spring (9), in spool position by the solenoid (2). The force of the solenoid (2) acts via the angled lever (6) and the ball (7) on the spool (8) which is sealed on two sides. The space between the two sealing elements is connected to port P. Thus, the valve system (3) is pressure-compensated in relation to the actuating forces (solenoid or return spring). The valves can therefore be used up to 630 bar [9150 psi].

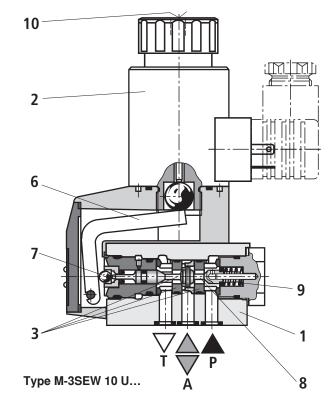

If Note!

- 3/2-directional seat valves feature a "negative spool underlap". For this reason, port T must always be connected. This means that during the switching process when one valve seat starts to open until the other valve seat is closed ports P-A-T are connected to each other. This process takes, however, place within such a short time that it is irrelevant in nearly all applications.
- The manual override (10) allows for the switching of the valve without solenoid energization.

Attention!

Care must moreover be taken that the specified maximum flow is not exceeded! If required, a throttle insert must be used to limit the flow (see page 12). The seat arrangement offers the following options:

Function, section, symbols: 4/2 directional seat valve

With a sandwich plate, the Plus-1 plate, under the 3/2 directional seat valve, the function of the 4/2 directional seat valve can be achieved.

Function of the Plus-1 plate:

Initial position

The main valve is not operated. The spring (9) holds the ball (4) on the seat (11). Port P is blocked and A connected to T. Moreover, one pilot line is connected from A to the large area of the control spool (12), which is thus unloaded to the tank. The pressure applied via P now pushes the ball (13) onto the seat (14). P is now connected to B, and A to T.

Transition position

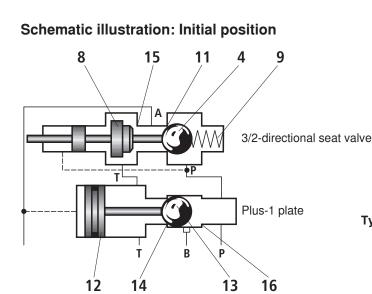

When the main valve is operated, the spool (8) is shifted against the spring (9) and pressed onto the seat (15). During this, port T is closed, P, A, and B are briefly connected to each other.

Spool position 0

P is connected to A. Because the pump pressure acts via A on the large area of the control spool (12), the ball (13) is pressed onto the seat (16). Thus, B is connected to T, and P to A. The ball (13) in the Plus-1 plate has a "positive spool underlap".

Attention!

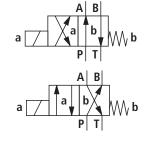

To prevent pressure intensification in conjunction with single-rod cylinders, the annulus area of the cylinder must be connected to A.

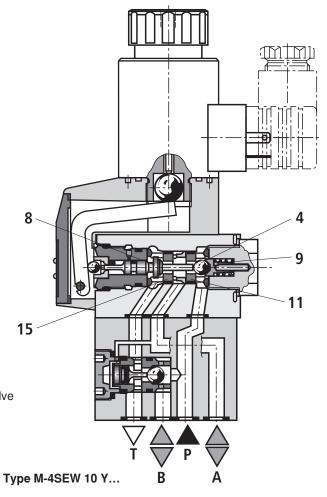

The use of the Plus-1 plate and the seat arrangement offer the following options:

Maximum surface temp	erature of the spool ⁵⁾	°C [°F]	120 [248]					

¹⁾ Suitable for NBR and FKM seals

²⁾ Only suitable for FKM seals

³⁾ The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and at the same time increases the service life of the components.

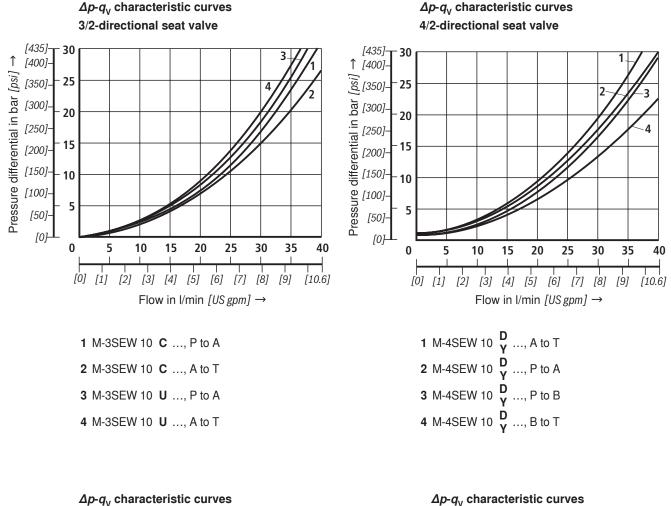

For selecting the filters, see datasheets RE 50070, RE 50076, RE 50081, RE 50086, RE 50087 and RE 50088.

⁴⁾ Special voltages upon request

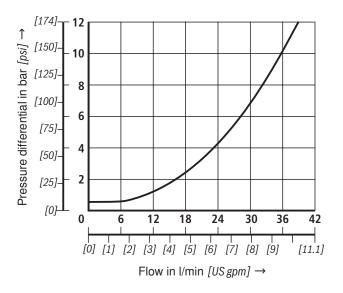

⁵⁾ Due to the temperatures occurring at the surfaces of the solenoid coils, the standards ISO 13732-1 and EN 982 need to be adhered to!

When establishing the electrical connection, the protective earthing conductor (PE $\frac{1}{2}$) must be properly connected.

Mating connectors according to DIN EN 175301-803

Throttle insert

The use of a throttle insert is required when due to prevailing operating conditions, flows can occur during the switching processes, which exceed the performance limit of the valve.

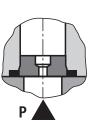

Examples:

- Accumulator operation,
- Use as pilot control valve with internal pilot fluid tapping.

3/2-directional seat valve (see page 3) The throttle insert is inserted in port P of the seat valve.

4/2 directional seat valve (see page 4)

The throttle insert is inserted in port P of the Plus-1 plate.

Check valve insert

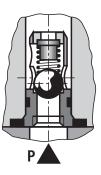

The check valve insert allows a free flow from P to A and closes A to P in a leak-free form.

3/2-directional seat valve (see page 3)

The check valve insert is inserted in port

P of the seat valve. 4/2 directional seat valve (see page 4)

The check valve insert is inserted in port P of the Plus-1 plate.

General Notes

- In order to switch the valve safely or maintain it in its spool position, the pressure situation must be as follows: P ≥ A ≥ T (for design reasons).
- Ports P, A and TA (3/2 directional seat valve) as well as P, A, B and TA (4/2 directional seat valve) are clearly assigned according to their function. They must not be exchanged or closed. The flow is only permitted in the direction of arrow.
- When the Plus-1 plate (4/2-directional function) is used, the following lower operating values must be taken into account:
 *p*_{min} = 8 bar; *q*_V > 3 l/min.
- The total flow of the valve must not be exceeded.
