

3/2, 4/2 and 4/3 directional valves, internally pilot operated, externally pilot operated

RE 24851/08.08

1/36

Types WPH, WHH, WMMH, WMDH, WMDAH, WMRH and WМУH

Sizes 10 to 32
Component series 4X; 6X; 7X
Maximum operating pressure 350 bar [5076 psi]
Maximum flow 1100 l/min [290 US gpm]

tb0253+0254

Table of contents

Content	Page
Features	1
Ordering code	2, 3
Spool symbols	4 to 7
Function, section	8, 9
Pilot oil supply	10, 11
Technical data	12, 13
Characteristic curves, performance limits	14 to 24
Unit dimensions	25 to 31
Stroke adjustment, mounting options	32, 33
Switching time adjustment	34
Pressure reducing valve "D3"	34
Pre-load valve	35

Features

- 7 types of actuation:
 - Pneumatic-hydraulic (type WPH)
 - Hydraulic-hydraulic (type WHH)
 - Hand lever (type WMMH)
 - Rotary knob (type WMDH)
 - Rotary knob, lockable (type WMDAH)
 - Roller plunger (type WMRH)
 - Roller plunger, rotated 90° (type WМУH)
- For subplate mounting
- Porting pattern to ISO 4401 and NFPA T3.5.1 R2-2002
- Subplates according to data sheets RE 45054 to RE 45060 (separate order), see page 30
- Spring centering, spring end position or hydraulic end position
- Manual override, optional
- Switching time adjustment, optional
- Pre-load valve in channel P of the main valve, optional
- Stroke adjustment of main spool, optional
- Stroke adjustment and/or end position check, optional
- Inductive position switches and proximity sensors (contactless), see RE 24830

 $p_{St\ min}$ = pilot pressure, minimum
 p_{Tank} = tank pressure
 p_o = cracking pressure

**Standard types and components are shown
in the EPS (standard price list).**

For the explanation of footnotes, see page 3!

Spool symbols: 2 spool positions

- 1) Only for NG10 and 25 (4W.H 22.)
If operating pressure > tank pressure, port T must be used as leakage port!
- 2) Only types WMRH/WMUH and WMMH available.

⚠ Attention!
Caution in conjunction with single-rod cylinders due to pressure intensification!

Function, section: Types WPH and WHH

Directional valves Type WPH and WHH

Valves of type WPH are directional spool valves with pneumatic-hydraulic actuation, type WHH with hydraulic-hydraulic actuation. They control the start, stop and direction of a flow.

These directional valves basically consist of the main valve with housing (1), main control spool (2), one or two return springs (3.1) and (3.2), as well as pilot valve (4).

Main control spool (2) in the main valve is held in the zero or initial position by springs or through pressurization. In the initial position, the two spring chambers (5) and (7) are connected via pilot valve (4) pressureless to the tank. Pilot valve (4) is supplied with pilot oil via pilot channel (6). The supply can be provided internally or externally (externally via port X).

When the pilot valve is operated, e.g. side "a", pilot spool (8) is pushed to the left, and spring chamber (7) is consequently pressurized to pilot pressure. Spring chamber (5) remains pressureless.

The pilot pressure acts on the left side of main control spool (2) and pushes it against spring (3.1). As a result, port P is connected to B, and A to T in the main valve.

In the non-operated condition, control spool (8) is held by return spring (9) in the central or initial position (except for impulse spool). Spring chamber (7) is unloaded to the tank.

The pilot oil is displaced from the spring chamber via pilot valve (4) into channel Y.

The pilot oil is supplied and drained internally or externally (externally via port Y).

An optional manual override (10) allows pilot spool (8) to be moved (8) without pneumatic pressure (type WPH only).

Note!

Return springs (3.1) and (3.2) in spring chambers (5) and (7) hold main control spool (2) in the central position without pilot pressure, also in the case of, for example, a vertical valve arrangement.

Pilot valve for type WHH, see RE 22282.

Pilot oil supply (sections A – A and B – B), see pages 10 and 11.

Function, section: Type WM.H

Directional valves of type WM.H

Valves of type WM.H are directional spool valves with mechanical-hydraulic actuation. They control the start, stop and direction of a flow.

These directional valves basically consist of the main valve with housing (1), main control spool (2), one or two return springs (3.1) and (3.2), as well as the pilot valve (4).

The function of these valves corresponds to that of type WPH. The pilot valve is, however, actuated mechanically.

For pilot valves for types WMDH, WMDAH, WMRH, WMUH, see RE 22280.

Pilot oil supply (sections A – A and B – B), see pages 10 and 11.

Pilot oil drain

External: 1 closed
Internal: 1 open

For further details and explanations of items, see next page.

Pilot oil supply

Type 4W.H...

The pilot oil is supplied **externally** - via channel X - from a separate circuit.

The pilot oil is drained **externally** - via channel Y - into the tank.

Type 4W.H...E...

The pilot oil is supplied **internally** from channel P of the main valve (see also page 13, footnotes ⁶⁾ and ⁷⁾)

The pilot oil is drained **externally** - via channel Y - into the tank. Port X in the subplate must be plugged.

Type 4W.H...ET...

The pilot oil is supplied **internally** from channel P of the main valve.

The pilot oil is drained **internally** - via channel T - into the tank. Ports X and Y in the subplate must be plugged.

Type 4W.H...T...

The pilot oil is supplied **externally** - via channel X - from a separate circuit.

The pilot oil is drained **internally** - via channel T - into the tank. Port Y in the subplate must be plugged.

- 1 Plug screw M6, 3 A/F
– Pilot oil drain
- 2 Plug screw M6, 3 A/F
– Pilot oil supply
- 3 Pilot valve
- 4 Main valve
- 5 Cover
- 6 Throttle insert

Tightening torques M_T for cover mounting screws:

NG16: 35 Nm [25.8 ft-lbs] ±10%;

NG25: 68 Nm [50.2 ft-lbs] ±10%

Tightening torques M_T for mounting screws for the pilot valve: **NG10 to 32:** 9 Nm [6.6 ft-lbs] ±10%

Throttle insert

The use of throttle insert (6) is required, if the pilot oil supply is to be limited in channel P of the pilot valve (see below).

Throttle insert (6) is to be installed in channel P of the pilot valve.

⚠ Attention!

The pilot oil supply may exclusively be modified by authorized specialists or in the factory!

- Pilot oil supply X or drain Y **external**:
 - For NG10, version SO30 must be provided for the use of sandwich plates. Code SO30 must be added at the end of the type designation (sandwich plate).
 - The adherence to the permissible maximum operating parameters must be ensured (see RE 22280 and RE 22282)!
 - Maximum pilot pressure: please read page 12!
- Pilot oil supply **internal** (version “ET” and “E”):
 - Minimum pilot pressure: please read page 13!
 - To prevent impermissibly high pressure peaks, a **throttle insert “B10”** must be provided in the P port of the pilot valve (see above).
 - In conjunction with version “H-“ **pressure reducing valve “D3”** (see page 34) must be provided additionally.

Technical data (for applications outside these parameters, please consult us!)

1) Suitable for NBR **and** FKM seals

2) Suitable **only** for FKM seals

3) – Pilot oil supply **internal**:

- In the case of higher pilot pressure, a pressure reducing valve must be used.
- In conjunction with version “H-“ **pressure reducing valve “D3”** must be provided additionally. (If it is not used, pilot pressure = operating pressure at the port)

– Pilot oil supply **external**:

- In conjunction with version “H-“ the adherence to the maximum pilot pressure must be ensured by taking suitable measures (e.g. protection of the separate pilot oil circuit through the use of a pressure relief valve)!

4) The cleanliness classes specified for components must be adhered to in hydraulic systems. Effective filtration prevents malfunction and, at the same time, prolongs the service life of components.

For the selection of filters, see data sheets RE 50070, RE 50076, RE 50081, RE 50086, RE 50087 and RE 50088.

5) Spool S for NG16 only

6) With symbols C, F, G, H, P, T, V, Z, internal pilot oil supply is only possible, if in the central position (in the case of 3-spool-position valve) or while passing the central position (in the case of 2-spool-position valve) the flow from P to T is so large that the pressure differential from P to T reaches a value of at least 6.5 bar [94 psi].

7) For spools C, F, G, J, H, P, T, V, Z, S ⁵⁾ – through pre-load valve (not for size NG10) or correspondingly large flow. (For the establishment of the required flow, see characteristic curves “pre-load valve”, page 35.)

⚠ Attention!

¹⁾ When the specified flow values are exceeded, the function of the return spring can no longer be guaranteed in the event of a pilot pressure failure!

For further important notes, see page 24!

Performance limits: Important notes

General:

⚠ Attention!

The specified switching performance limits are valid for operation with two directions of flows (e.g. from P to A and simultaneous return flow from B to T in the ratio of 1:1).

Due to the flow forces acting within the valves, the permissible switching performance limits may be considerably lower with only one direction of flow (e.g. from P to A while port B is blocked, with flow in only one direction or different flows)!

In the case of such applications, please consult us!

The switching performance limit was established while the solenoids had reached operating temperature, at 10 % undervoltage and without tank pre-loading.

⚠ Attention!

NG16	<ul style="list-style-type: none"> – With X internal pilot oil supply, a pre-load valve must be used at flows < 160 l/min [42 US gpm] due to the negative overlap of spools C, Z and HC, HZ. – When 4/3 directional valves with pressure-centered control spool in the main valve are operated beyond the specified performance limit, a higher pilot pressure is required. At, for example, an operating pressure of $p_{\max} = 350 \text{ bar}$ [5076 psi] and a flow of $q_v = 300 \text{ l/min}$ [79 US gpm] a pilot pressure of 16 bar [232 psi] is required. The maximum flow for these valves therefore only depends on the Δp value, which is acceptable for the system. – With X internal pilot oil supply, a pre-load valve must generally be used (see page 35) due to the negative overlap of spools F, G, H, J, P, S, and T.
NG25	<ul style="list-style-type: none"> – With X internal pilot oil supply, a pre-load valve must be used at flows < 180 l/min [47.5 US gpm] due to the negative overlap of spools Z, HZ, and V. – With X internal pilot oil supply, a pre-load valve must generally be used due to the negative overlap of spools C, HC, F, G, H, P, and T.
NG32	<ul style="list-style-type: none"> – With X internal pilot oil supply, a pre-load valve must be used at flows < 180 l/min [47.5 US gpm] due to the negative overlap of spools Z, HZ, and V. – When 4/3 directional valves with pressure-centered control spool in the main valve are operated beyond the specified performance limit, a higher pilot pressure is required. At, for example, an operating pressure of $p_{\max} = 350 \text{ bar}$ [5076 psi] and a flow of $q_v = 1100 \text{ l/min}$ [290 US gpm] a pilot pressure of 15 bar [217 psi] is required. The maximum flow for these valves therefore only depends on the Δp value, which is acceptable for the system. – With X internal pilot oil supply, a pre-load valve must generally be used due to the negative overlap of spools C, HC, F, G, H, P and T.

Unit dimensions: NG10 (dimensions in mm [inch])

Required surface quality of valve mounting face

– NG32:

6 hexagon socket head cap screws, metric
ISO 4762 - M20 x 80 - 10.9-fZn-240h-L
 (Friction coefficient $\mu_{\text{total}} = 0.09$ to 0.14);
 tightening torque $M_T = 430 \text{ Nm}$ [317.2 ft-lbs] $\pm 10\%$,
 Material no. **R901035246**

6 hexagon socket head cap screws, UNC
3/4-10 UNC x 3 1/4" ASTM-A574
 on request

Stroke adjustment, mounting options (dimensions in mm [inch])

The stroke adjustment feature limits the stroke of control spool (1). To shorten the spool stroke, loosen locknut (2) and turn adjustment spindle (3) clockwise. During this, pressure chamber (4) must be pressureless.

NG	L4
10	6.5 [0.26]
16	10 [0.39]
25 (type 4W.H 22)	9.5 [0.37]
25 (type 4W.H 25)	12.5 [0.49]
32	15 [0.59]

For further dimensions see below and page 33.

5 Adjustment range

- NG10:
1 turn = 1 mm [0.0394 inch] adjustment travel
- NG16 to 32:
1 turn = 1.5 mm [0.0591 inch] adjustment travel

Stroke limitation on side A

Stroke limitation on side B

¹⁾ Type 4W.H 22

²⁾ Type 4W.H 25

Switching time adjustment

The switching time of main valve (1) can be influenced by using a double throttle check valve (2) (type Z2FS 6 to data sheet RE 27506).

Conversion of meter-in (3) into meter-out control (4):

Remove pilot valve (5) – plate (6) for accommodating the seal rings remains in place – turn switching time adjustment feature (2) around its longitudinal axis and put it down again, re-mount pilot valve (5) .

Tightening torque of screws (7) $M_T = 9 \text{ Nm}$ [6.6 ft-lbs].

⚠ Attention!

The conversion may only be carried out by authorized specialists or in the factory!

Type 4W.H 10 ..4X/...S

Type 4W.H 10 ..4X/...S2

Pressure reducing valve "D3"

Pressure reducing valve (8) must be used in the case of pilot pressures above 250 bar [3626 psi] (with type 4W.H 22 ...: 210 bar [3046 psi]) and version "H-".

The secondary pressure is held constant at 45 bar [652 psi].

⚠ Attention!

When a pressure reducing valve "D3" (8) is used, a throttle insert "B10" must be provided in the P channel of the pilot valve.

Tightening torque of screws (7) $M_T = 9 \text{ Nm}$ [6.6 ft-lbs].

Type 4W.H 10 ..4X/.../..D3

Pre-load valve (not for NG10)

For valves with pressureless circulation and internal pilot oil supply, a pre-load valve (9) must be installed in channel P of the main valve to build up the minimum pilot pressure.
The pressure differential of the pre-load valve must be added

to the pressure differential of the main valve (see characteristic curves) to obtain a total value.
The cracking pressure is ca. 4.5 bar [65 psi].

- 9.1 Pre-load valve NG16
- 9.2 Pre-load valve NG25 and NG32
- 10 Main valve
- 11 Subplate
